

The Intelligent Solution to Intelligence Gathering

New Modules Enhance World's Most Comprehensive Covert Policing Software

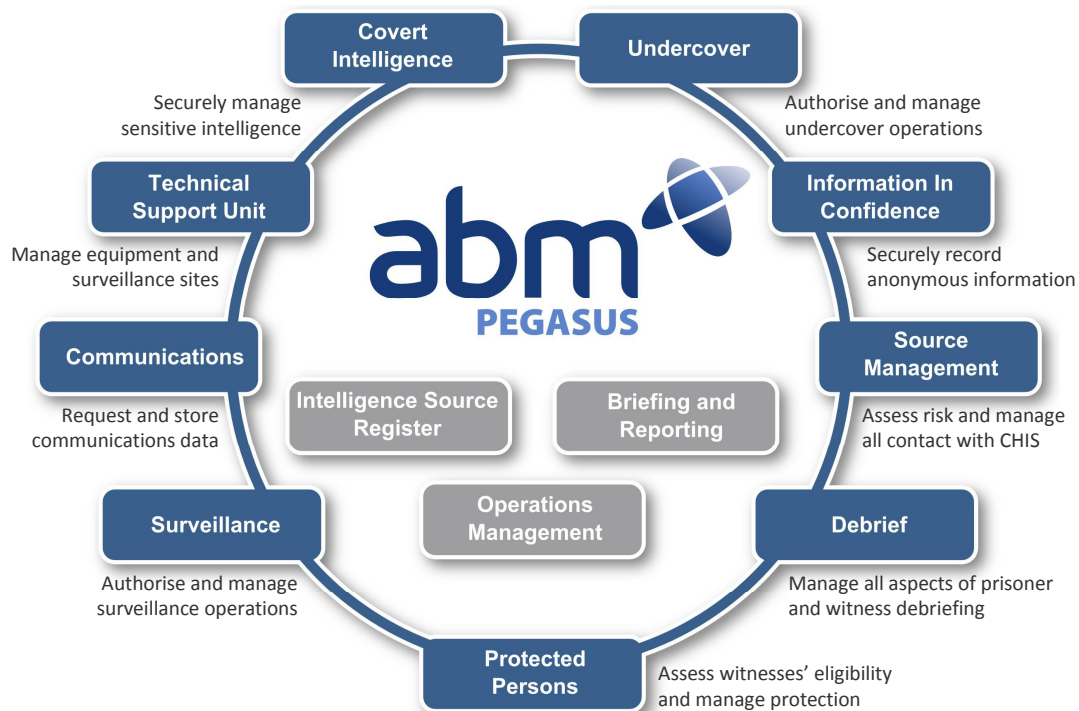

Nottingham, 18 October 2011 – Intelligence and law enforcement software specialist, ABM, has revealed a number of new additions to its covert operations suite, abmpegasus. The new modules will expand abmpegasus to make it the most comprehensive software tool designed specifically for covert policing.

ABM's new covert policing modules cover five crucial areas of law enforcement – **undercover operations, technical support units, prisoner and witness debriefing, protected persons and covert intelligence**. Each module provides functionality to reduce the cost and time associated with administration of covert activity – an issue that is of continued concern to law enforcement. Critically, the new abmpegasus modules also improve compliance with relevant policies and legislation and help to mitigate risk. Furthermore, the systems improve the management of intelligence gathered from covert operations, ensuring that return on investment is maximised.

Police budgets are already under significant pressure and further resource cuts are expected. Cost effective IT systems that streamline complex procedures are a crucial tool in achieving the aim of cutting administration costs without affecting performance.

Tim Eatherington, Managing Director of ABM, said "We have been developing systems to manage sensitive areas of policing for fifteen years. Over that time covert policing has become more important, more regulated and more expensive. The need for coordinated systems to manage resources, save time and improve efficiency without compromising security is greater than ever. By expanding upon the highly successful abmpegasus system, police forces can now manage all covert activity through one system, presenting opportunities to save money on training and hardware."
